

TeamConnect® Data Warehouse

6.1.1 Patch 1 Release Notes

Data Warehouse 6.1.1 patch 1 release provides the following enhancements:

Enhancement: Incremental loading in Initial & Refresh for objects

Impact: In the previous Data Warehouse design, initial load processed for complete data at a time. When there is failure while processing, the job will process it from the beginning. Refresh also works in a similar way.

From this release, install and refresh will be done incrementally and keeps track of what has been processed to reduce the number of redo in case of failure.

Following are the objects upgraded for incremental loading:

- PROJECT
- ACCOUNT
- HISTORY
- INVOLVED
- INVOICE

For more information on how to resume the job, refer to [How to resume the failed refresh job?](#)

Tracking Code: TC-36633

Enhancement: Gather Stat after initial and refresh

Impact: To improve the database query performance

Tracking Code: TC- 37658

Enhancement: Enable Materialized View Refresh refresh in DW

Additional Information:

If the target database uses an Oracle database server, the Data Warehouse login must have the CREATE MATERIALIZED VIEW system privilege, in addition to the rights and privileges mentioned for Oracle in the TeamConnect release notes.

- If there is a need for custom MATERIALIZED VIEW, then CREATE JOB privilege is needed to allow the DataWarehouse to refresh the MView right after the refresh is complete.

If the target database uses a SQL Server database server, its configuration must also be altered as follows:

- ALTER DATABASE <dbname> SET ALLOW SNAPSHOT_ISOLATION ON
- ALTER DATABASE <dbname> SET READ_COMMITTED_SNAPSHOT ON
- MSSQL Integrated Security is supported. The Attributes can be configured in the shared.xml file. shared-MSSQL.xml has the sample attributes to be configured. You could either copy those attributes to shared.xml or rename the shared-MSSQL.xml into shared.xml. DataWarehouse considers the shared.xml file only.

Tracking Code: TC- 36655

Enhancement: Optimize GET_LOAD_TRANSFORMS_XXXX

Impact: Resolve Cartesian Product to increase performance

Tracking Code: TC- 35912

Enhancement: Create bat/sh executable for refresh resume

Impact: The new batch/sh file allow resuming refresh when failed

Tracking Code: TC- 35913

Enhancement: Optimize WH_CATEGORY_UPDATE flow

Impact: Update trigger to update category only when the name changed.
